

**ANEMIA:**

**DEFINITION:**

- Reduced # of circulating RBCs
- Reduced RBC mass
- Reduced Hgb concentration
- Reduced hematocrit (Hct)

**ETIOLOGY:**

- Nutritional deficiencies
  - Iron, vitamin B12, folic acid
- Disease-induced (acute/chronic)
  - ↓ RBC production
    - ▶ ex// BMD
  - ↑ RBC destruction
    - ▶ ex// hemolysis
  - ↑ RBC loss
    - ▶ ex// acute/chronic bleeding
- Drug-induced
  - Chloramphenicol, diclofenac, indomethacin, gold salts, phenytoin, carbamazepine, sulfa, chemo, etc

**WHO CLASSIFICATION:**

Normal (Hgb)	Women: 120-160 g/L Men: 140-180 g/L
Mild (grade 1)	100 g/L – LLN
Mod (grade 2)	Hb 80 – 99 g/L
Severe (grade 3)	Hb 65-79 g/L
Life-threatening (grade 4)	Hb < 65 g/L

**TYPES & EXAMPLES:**

<b>Macrocytic</b>	<ul style="list-style-type: none"> <li>• B12-deficiency anemia</li> <li>• Folate-deficiency anemia</li> </ul>
<b>Microcytic</b>	<ul style="list-style-type: none"> <li>• Iron-deficiency anemia</li> </ul>
<b>Normocytic</b>	<ul style="list-style-type: none"> <li>• Cancer-related anemia</li> <li>• Anemia of CKD</li> <li>• Cardiorenal anemia</li> <li>• Acquired anemia in hospitalized pt</li> </ul>

**PATHOPHYSIOLOGY:**

<b>Erythropoietin</b>	<ul style="list-style-type: none"> <li>• Hormone stimulating proliferation &amp; differentiation of erythroid precursors in bone marrow</li> <li>• Maintains RBC mass via feedback mechanism</li> <li>• Normal endogenous level = 10-20 units/L</li> <li>• 90% produced in kidney, 10% in liver</li> <li>• ↓ O<sub>2</sub>-carrying capacity → renal peritubular cells → erythropoietin released into blood</li> </ul>
<b>Burst-forming units (BFUe)</b>	<ul style="list-style-type: none"> <li>• Earliest progenitors → eventually develops into a CFUe</li> <li>• Influenced by cytokines (IL-3, GM-CSF); moderately sensitive to erythropoietin</li> </ul>
<b>Colony-forming unit</b>	<ul style="list-style-type: none"> <li>• Differentiates into erythroblasts &amp; reticulocytes</li> <li>• Highly sensitive to erythropoietin</li> </ul>

**CANCER-RELATED ANEMIA:**

**ETIOLOGY:**

<b>Cancer</b>	Examples	<ul style="list-style-type: none"> <li>• Non-Hodgkin’s lymphoma</li> <li>• Multiple myeloma</li> <li>• Lung cancer</li> <li>• Ovarian cancer</li> </ul>
	Contributing factors	<ul style="list-style-type: none"> <li>• Stage of cancer</li> <li>• Bleeding</li> <li>• Nutritional deficiencies</li> <li>• Hemophagocytosis</li> <li>• Myelosuppression</li> </ul>
<b>Chemo-therapy</b>	Examples	<ul style="list-style-type: none"> <li>• Cisplatin</li> <li>• Carboplatin</li> <li>• Paclitaxel</li> <li>• Vinorelbine</li> </ul>
	Contributing factors	<ul style="list-style-type: none"> <li>• Duration of chemotherapy</li> <li>• Bone marrow suppression</li> <li>• Hemolysis</li> <li>• Nutritional deficiencies due to nausea &amp; vomiting</li> <li>• Low erythropoietin production</li> </ul>
<b>Radiation therapy</b>		

**DIAGNOSIS & CLINICAL PRESENTATION:**

- Normochromic: normal MCHC (Hgb concentration in RBC)
- Normocytic: normal MCV (RBC size), low MCV, if underlying iron-deficiency (low-ferritin)
- Cancer present for more than 1-2 months
- Mild-moderate in severity
- Low reticulocytes, if poor bone marrow function
- Low serum iron & TIBC, but normal/high ferritin
- Bone marrow aspirate: high hemosiderin
- Fatigue, paleness, dizziness, SOB, hypoxia, tachycardia, palpitations

**TREATMENT OPTIONS:**

- **Definitive therapy: cure cancer**
- **Supportive care, including RBC transfusions:**
  - Increase Hgb level quickly
  - Improve anemia symptoms rapidly
  - Improve health-related quality of life
  - Exceptions: patients with presence of multiple alloantibodies and those refusing transfusions based on religious beliefs
- **Erythropoiesis Stimulating Agents (ESA):**
  - Example: Erythropoietin (Epoetin), Darbepoetin
  - May take weeks to months to increase Hgb
  - May stimulate cancer progression and increase mortality

**ESA:**

- Indicated: palliative myelosuppressive chemotherapy-induced anemia in some patients (consider: risks vs. benefits; patient preference)
- Not indicated: curative myelosuppressive chemotherapy-induced anemia
- Caution: patients with cancer not receiving chemotherapy, due to increased risk of thrombosis and reduced survival
- Not to be initiated if Hb > 100 g/L
- Dose to lowest Hgb level, sufficient to avoid blood transfusions
  - Increased risk of death & serious CV events (thrombosis, HTN)
- Discontinue ESA if lack of response after 6-8 weeks of therapy

**COMPLICATIONS:**

- Debilitating fatigue
- Compromised QOL
- Depression
- Impaired cognitive fxn
- ↓ ability to complete ADLs
- CV complications
- Hypoxia
- Delay in cancer txt → cancer progression
- Death

**GOALS OF THERAPY:**

- Resolve signs and symptoms of anemia
- Treat underlying cause
- Improve quality of life
- Prevent recurrences
- Prevent complications
- Prevent/minimize treatment-related side effects

**MONITORING PARAMETERS:**

- S/S of anemia, including RBC, Hgb, Hct, MCV, etc
- Efficacy of RBC transfusions (if indicated): 1 unit RBC → ↑ Hgb by 10 g/L, ↑ Hct by 2-3% in an average 70 kg adult
- SEs of RBC transfusions: transfusion reactions (fever, chills, resp distress, hives, pruritis, hypersensitivity, hemolysis, etc) ; volume overload ; CHF ; iron overload; infection; contamination
- Cancer progression
- Chemotherapy and/or radiation therapy side effects

**THROMBOCYTOPENIA:**

**DEFINITION:**

- Platelet count below the LLN (< 150 x 10<sup>9</sup>/L)
  - Normal adults: 150-450 x 10<sup>9</sup>/L

Mild	100 – 150 x 10 <sup>9</sup> /L
Moderate	50-99 x 10 <sup>9</sup> /L
Severe	< 50 x 10 <sup>9</sup> /L

- Numbers must be interpreted in the context of the underlying disease
  - Lower values may be appropriate for certain conditions (ex// cancer-related thrombocytopenia)

**PATHOPHYSIOLOGY:**

- Decreased platelet production in bone marrow
- Destruction of peripheral platelets by antibodies
- Consumption of platelets by thrombi
- Dilution of platelets from fluid resuscitation or massive transfusion
- Sequestration (pooling) of platelets in the spleen due to portal hypertension and/or splenomegaly

**ETIOLOGY:**

Primary immune thrombocytopenia (ITP)	
Food & beverages	• Alcohol, quinine containing tonic water,
Infection/sepsis	• HIV, hepatitis C, Epstein-Barr virus, H. pylori, etc
Hypersplenism	• Due to chronic liver disease
Drug-induced immune thrombocytopenia (DITP)	• Heparin, LMWH, quinine, sulfonamides, acetaminophen, cimetidine, ibuprofen, naproxen, ampicillin, piperacillin, vancomycin, glycoprotein IIB/IIIA inhibitors (abciximab, tirofiban, eptifibatide, etc)
Heparin-induced thrombocytopenia (HIT)	• Uncommon side effect of unfractionated heparin (2.6%) or low-molecular-weight heparin (0.2%) • Independent of dose, schedule, or route of administration • Immune mediated HIT (Type 2) is far more serious (life-threatening) than non-immune mediate HIT (Type 1) • HIT may occur several days after initiation of heparin • Complications of HIT included skin necrosis, limb gangrene (sometimes requiring amputation), and organ infarction
Nutritional deficiencies	• Vit B12, folate, copper
Autoimmune disorders	• Lupus, rheumatoid arthritis
Inherited thrombocytopenia	• Fanconi syndrome
Other	• Pregnancy • Antiphospholid syndrome (APS) • Myelodysplasia
Cancer-related	• Cancer, chemotherapy, radiation therapy

**CANCER-RELATED THROMBOCYTOPENIA:**

**ETIOLOGY:**

- Cancer
- Chemotherapy
  - Predictable, dose-dependent myelosuppression
  - Affects all blood cell lines

Grade 1	75-150 x 10 <sup>9</sup> /L
Grade 2	50-74 x 10 <sup>9</sup> /L
Grade 3	25-49 x 10 <sup>9</sup> /L
Grade 4	< 25 x 10 <sup>9</sup> /L

- Radiation therapy

**TREATMENT OPTIONS:**

- Treat underlying cause
- Assess and address potential drug therapy causes
  - IM injections, ASA/NSAID therapy, NHPs (ex// Ginkgo) should be avoided
  - Provide drug therapy alternatives, where appropriate
  - Anticoagulation therapy may need to continue, depending on indication and severity of thrombocytopenia
- Assess severity of thrombocytopenia
- Restrict physical activity if platelets < 50 x 10<sup>9</sup>/L
- Infuse platelets, when indicated
- Consult with hematologist as appropriate

**DIAGNOSIS, CLINICAL PRESENTATION & COMPLICATIONS:**

- Platelet count below normal
- Potential causes identified (cancer, chemotherapy, radiation therapy, heparin, LMWH, other drugs, etc)
- Easy bruising
- Petechia, purpura
- Bleeding
- Delay in cancer txt → cancer progression
- Enlarged spleen
- Jaundice
- Thrombosis
- Death

**GOALS OF THERAPY:**

- Resolve S/S of thrombocytopenia
- Treat underlying cause
- Improve quality of life
- Prevent recurrences, prevent complications
- Prevent/minimize treatment-related side effects

**MONITORING PARAMETERS:**

- S/S of thrombocytopenia, including platelet count
- Efficacy of platelet transfusions (if indicated)
- Side effects of platelet transfusions:
  - Transfusion reactions (fever, chills, respiratory distress, hives, pruritic, hypersensitivity, hemolysis, etc)
  - Volume overload, CHF
  - Infection, contamination
- Cancer progression
- Chemo and/or radiation therapy side effects

**VENOUS THROMBOEMBOLISM (VTE):**

**DEFINITION:**

Deep vein thrombosis (DVT)	<ul style="list-style-type: none"> <li>• Formation of a blood clot in a deep vein                             <ul style="list-style-type: none"> <li>◦ <u>Symptomatic</u>: sx usually lead to radiologic confirmation of DVT</li> <li>◦ <u>Asymptomatic</u>: incidental finding of DVT on imaging in pt w/o sx (ex// CT Scan)</li> </ul> </li> <li>• Mostly occurs in lower leg or thigh, but can occur anywhere in the body                             <ul style="list-style-type: none"> <li>◦ <u>Proximal DVT</u>: clot located in popliteal, femoral or iliac veins</li> <li>◦ <u>Distal DVT</u>: clot located below knee &amp; confined to calf veins</li> </ul> </li> </ul>
Pulmonary embolism (PE)	<ul style="list-style-type: none"> <li>• Blockage of a pulmonary artery by a blood clot (due to a pre-existing DVT or newly formed)</li> </ul>

**CLINICAL PRESENTATION**

DVT	<ul style="list-style-type: none"> <li>• Swelling (typically unilateral but can be bilateral)</li> <li>• Pain, redness, discoloration</li> </ul>
PE	<ul style="list-style-type: none"> <li>• SOB, tachypnea</li> <li>• Pleuritic chest pain, pleural rub</li> <li>• Hypoxia, hemoptysis</li> <li>• Tachycardia, right HF</li> <li>• Syncope</li> </ul>

**VTE CONTINUED:**

**PATHOPHYSIOLOGY: Virchow Triad**

Vascular endothelial injury	<ul style="list-style-type: none"> <li>• Surgery</li> <li>• Trauma</li> </ul>
Alteration in blood flow (stasis)	<ul style="list-style-type: none"> <li>• Heart failure</li> <li>• Increased blood thickness</li> <li>• Small blood clots</li> <li>• Prolonged immobilization</li> </ul>
Alterations in constituents of blood	<ul style="list-style-type: none"> <li>• Anticlotting factor deficiencies</li> <li>• Autoimmune disorders</li> <li>• Platelet disorders</li> <li>• Cancer</li> </ul>

**DIAGNOSIS:**

<b>DVT</b>	<ul style="list-style-type: none"> <li>• Compression ultrasonography (↑ sensitivity/specificity)</li> </ul>
<b>PE</b>	<ul style="list-style-type: none"> <li>• Spiral CT angiography</li> <li>• Magnetic resonance pulmonary angiograph                             <ul style="list-style-type: none"> <li>◦ If contrast media is contraindicated</li> </ul> </li> <li>• Ventilation/perfusion (V/Q) scintigraphy (↓ sensitivity/specificity)                             <ul style="list-style-type: none"> <li>◦ If severe renal failure</li> </ul> </li> </ul>
<b>Atypical sites</b>	<ul style="list-style-type: none"> <li>• Ex// cerebral venous thrombosis, intra-abdominal thrombosis</li> <li>• MRI</li> </ul>

**CANCER-RELATED VTE:**

**ETIOLOGY & RISK FACTORS:**

Patient-related factors	<ul style="list-style-type: none"> <li>• ≥ 65 years</li> <li>• African American</li> <li>• Comorbidity (obesity, infection, renal disease, pulmonary disease, arterial thromboembolism)</li> <li>• Prior history of VTE</li> <li>• High pre-chemotherapy platelet count &gt; 350 x 10<sup>9</sup>/L</li> <li>• Heritable prothrombotic mutations</li> <li>• Immobilization</li> </ul>
Cancer-related factors	<ul style="list-style-type: none"> <li>• Primary site of cancer (ex// brain, gynecologic, hematologic, lung, pancreas, renal, stomach)</li> <li>• Initial 3-6 months after diagnosis</li> <li>• Current metastatic disease</li> </ul>
Txt-related factors	<ul style="list-style-type: none"> <li>• Recent major surgery</li> <li>• Active chemotherapy</li> <li>• Active hormonal therapy (ex// Tamoxifen)</li> <li>• Current or recent antiangiogenic therapy (Thalidomide, Lenalidomide, Bevacizumab)</li> <li>• Radiation therapy (possibly)</li> <li>• Current ESA</li> <li>• Presence of central venous catheters</li> </ul>

**TREATMENT OPTIONS:**

- Low molecular weight heparin (LMWH): **1\* choice**
- Warfarin therapy (overlap with initial LMWH or unfractionated heparin or fondaparinux until INR 2-3 for 2 days)
- Direct oral anticoagulants:
  - Dabigatran (direct thrombin inhibitor)
  - Rivaroxaban, apixaban, edoxaban (factor Xa inhibitors)
  - Lack of sufficient evidence for VTE txt in cancer
- Duration of therapy: 6 months or longer

**MONITORING PARAMETERS:**

- Signs and symptoms of VTE
- Efficacy of anticoagulation therapy
- Side effects of anticoagulation therapy: bleeding, thrombocytopenia, other side effects depending on specific drug therapy
- Lab markers:
  - aPTT for unfractionated heparin
  - anti-Xa levels for LMWH in renal failure & obesity
- Cancer progression
- Chemotherapy and/or radiation therapy side effects

**COMPLICATIONS:**

- Potential sign of underlying malignancy
- Interference with anticancer therapy → cancer progression
- Compromised QOL
- Hospitalization, mortality

**GOALS OF THERAPY:**

- Relieve signs and symptoms
- Treat underlying cause
- Prevent complications
- Improve QOL
- Prevent recurrences (secondary VTE prophylaxis)
- Prevent/minimize treatment-related side effects
- Prolong survival

**PRIMARY VTE PROPHYLAXIS IN CANCER:**

- Considered for high risk cancer patients:
  - Family hx of VTE
  - Presence of inherited thrombophilia
  - Comorbidities, older age, obesity, immobility, concomitant medications (including chemotherapy), etc
  - Metastatic cancer
  - Hospitalization
  - Surgery
- Not routinely recommended for ambulatory care patients with cancer at this time
- LMWH or unfractionated heparin are commonly used for primary VTE prophylaxis in cancer patients
- Mechanical prophylaxis has not demonstrated efficacy
