

**MICROBIOLOGY:**

- 20 species, 3 pathogenic to humans
- Most common is *M. tuberculosis*
- Aerobic, rod-shaped (bacilli)
- Slow growing
- Acid-fast positive

**LATENT VS. ACTIVE TB:**

<b>LATENT</b>	<ul style="list-style-type: none"> <li>• Positive reaction to tuberculin skin test AND</li> <li>• Negative bacteriologic studies (if done) AND</li> <li>• No clinical, bacteriological, or radiographic evidence of active TB</li> </ul>
<b>ACTIVE TB</b>	<ul style="list-style-type: none"> <li>• <i>M. tuberculosis</i> cultured (if done) OR</li> <li>• Clinical, or CXR evidence of disease AND</li> <li>• Positive PPD test</li> </ul>

**NATURAL HISTORY OF TB:**

**CONDITIONS INCREASE RISK OF PROGRESSION TO ACTIVE TB:**

- CXR suggestive of previous TB
- HIV infection
- Substance abuse
- Cancer
- Diabetes mellitus, CKD
- Malnutrition
- Prolonged corticosteroid therapy
- Other immunosuppressive therapy

**COMMON SITES OF TB DISEASE:**

- Lungs
- CNS
- GU system
- Lymphatic system
- Bones & joints
- Disseminated (military TB)

**WHAT ARE THE GOALS OF THERAPY?**

- Eliminate signs and symptoms
- Prevent transmission to contacts
- Prevent development of resistance (adherence)
- Minimize ADRs
- Increase QOL
- Prevent relapse of TB

**ANTITUBERCULOSIS DRUGS:**

First line drugs	Second line drugs
<ul style="list-style-type: none"> <li>• Isoniazid</li> <li>• Rifampin               <ul style="list-style-type: none"> <li>◦ Rifabutin</li> <li>◦ Rifapentine</li> </ul> </li> <li>• Pyrazinamide</li> <li>• Ethambutol</li> </ul>	<ul style="list-style-type: none"> <li>• Streptomycin</li> <li>• Cycloserine</li> <li>• p-Aminosalicylic acid</li> <li>• Ethionamide</li> <li>• Amikacin/kanamycin</li> <li>• Capreomycin</li> <li>• Levo/moxi - floxacin</li> </ul>

**RIFABUTIN (RBT):**

- Similar activity as RMP but less CYP450 drug interactions (used in HIV-infected or transplant pts due to their meds)
- Hematologic toxicity is more

**RIFAPENTINE:**

- Once week dosing (5 times longer half-life than RMP)
- Not recommended due to higher rates of failure in HIV pts

**PATHOGENESIS:**

- Inhale droplet nuclei (1-5 um) which disseminates to the lung
- Ingested by macrophages, T lymphocytes activated & produce more reactive lymphocytes
- Macrophages have begin to form granulomas to contain the organisms, and activated lymphocytes now begin to destroy the MTB-containing macrophages
  - Dissemination is halted and bacteria within granulomas have avoided detection by lysis (**LATENT TB INFECTION = LTBI**)
- If the immune system cannot keep the bacilli under control, the bacilli begin to multiply rapidly **in the lung** and may spread via the bloodstream to seed a variety of organs with high blood flow: lymph nodes, posterior apical regions of the lung, bone, BM, liver, kidney, CNS (**ACTIVE TB DISEASE**)

**TRANSMISSION:**

- Spread by droplet nuclei
- Expelled when person with infectious TB coughs, sneezes or speaks
- Transmission occurs from person with ACTIVE infectious TB disease (not latent TB infection)

**PROBABILITY TB WILL BE TRANSMITTED:**

- **Infectiousness of person with TB**
  - Smear positive
  - Cavitory lesion on CXR
- **Closeness of individual**
- Duration of exposure
- Virulence of organism

**SYMPTOMS OF TB:**

- Fever
- Chills
- Night sweats
- Appetite loss
- Weight loss
- Easily fatigued
- Cough
- Hemoptysis
- Chest pain
- SOB
- Tachypnea
- Dullness/crackles

**DIAGNOSTIC TESTS FOR TB:**

<b>CHEST RADIOGRAPH</b>	<ul style="list-style-type: none"> <li>• Abnormalities often seen in apical segment of upper lobe or superior segments of lower lobe</li> <li>• Central for diagnosis of TB</li> </ul>
<b>SMEAR EXAMINATION</b>	<ul style="list-style-type: none"> <li>• Obtain 3 sputum specimens for smear examination and culture</li> <li>• Results (i.e. <b>AFB</b>) should be available within 24 hours</li> <li>• With treatment, bacteria load ↓ within 2 weeks</li> <li>• Some patients may take up to 4 months to clear</li> </ul>
<b>CULTURES</b>	<ul style="list-style-type: none"> <li>• Used to confirm diagnosis of TB</li> <li>• Culture all specimens, even if smear negative</li> <li>• Results in 6-12 weeks</li> <li>• Susceptibility testing on initial isolate</li> </ul>
<b>RAPID TESTS - NAAT</b>	<ul style="list-style-type: none"> <li>• Used to confirm diagnosis of TB</li> <li>• Detects PCR (high sensitivity &gt; 95%)</li> <li>• Results in 24-48 hours</li> <li>• Cannot get susceptibility</li> <li>• Can be used in the field to detect resistance</li> </ul>

**WHAT ARE THE VIABLE TREATMENT OPTIONS?**

<b>INITIAL</b>	<ul style="list-style-type: none"> <li>• Multiple drugs (INH, RMP, PZA, EMB) used for 2 months           <ul style="list-style-type: none"> <li>◦ Two best agents are INH and RIF</li> </ul> </li> <li>• Need drugs which are rapidly bactericidal</li> <li>• Ensures quick sputum conversion</li> </ul>
<b>CONTINUATION</b>	<ul style="list-style-type: none"> <li>• Normally use 2 drugs (INH/RMP) for another 4-7 months           <ul style="list-style-type: none"> <li>◦ Total duration = 6-9 months</li> </ul> </li> <li>• In patients with risk factors for relapse, continuous phase should be prolonged from 4 to 7 months (=9 months total therapy)           <ul style="list-style-type: none"> <li>◦ Extensive disease and/or cavities on CXR in first 2 m of txt</li> <li>◦ Culture positive after 2 months of txt</li> <li>◦ Having a cavity on CXR at end of treatment</li> </ul> </li> </ul>
<b>SECOND LINE</b>	<ul style="list-style-type: none"> <li>• Used if there is ADRs or resistance to first line agents</li> </ul>

**TREATMENT REGIMENS:**

	INITIAL PHASE (2 months)	CONTINUATION PHASE
<b>Standard</b>	INH RMP PZA EMB* daily or 5 days/week	INH RMP for 4 months daily or 3 times/week
<b>Elderly &gt; 65 or other risk factor for hepatotoxicity</b>	INH RMP EMB * daily or 5 days/week	INH RMP for 7 months daily or 3 times/week

\* EMB can be stopped as soon as the DST results are available if pan sensitive

**DOSING:**

	INH	RMP	PZA	EMB
<b>Daily dosing</b>	5 mg/kg (max 300 mg)	10 mg/kg	20-25 mg/kg (max 2 g)	15-20 mg/kg (max 1.6 g)
<b>3 x / week</b>	10 mg /kg (max 600 mg)	(max 600 mg)	30-40 mg/kg (max 4 g)	25-40 mg/kg (max 2.4 g)

**TOXICITIES OF ANTI-TB MEDICATIONS:**

	Common ADRs	Uncommon but important ADRs	Probability* of hepatitis	Probability* of rash
INH	Rash, hepatitis, neuropathy	CNS toxicity, anemia	2	3
RMP	Drug interactions, rash	Hepatitis, flu-like illness, neutropenia, thrombocytopenia	3	1
PZA	Hepatitis, rash, arthralgia	Gout	1	2
EMB	Eye toxicity	Rash	4	4

\* ranked from 1 = most likely, 4 = least likely

**MONITORING PARAMETERS:**

<b>EFFICACY</b>	<ul style="list-style-type: none"> <li>Resolution of signs and symptoms</li> <li>Physical exam parameters</li> <li>Diagnostic parameters (AFB, culture, CXR)</li> </ul>
<b>TOXICITY</b>	<ul style="list-style-type: none"> <li>Baseline, 1, 2, 4, 6 months for lab work                             <ul style="list-style-type: none"> <li>CBC, SCr, AST or ALT, visual acuity, rash, peripheral neuropathy</li> </ul> </li> </ul>

**LATENT TUBERCULOSIS INFECTION:**

**DIAGNOSTIC TESTS:**

<b>TUBERCULIN SKIN TEST</b>	<ul style="list-style-type: none"> <li>Inject intradermally 0.1 mL of 5TU PPD tuberculin</li> <li>Produce wheal 6 mm to 10 mm in diameter</li> <li>Read in 48-72 hours</li> <li>Read the induration, not the redness around</li> </ul>
<b>FACTORS THAT AFFECT SKIN TEST</b>	<b>BCG vaccine</b> <ul style="list-style-type: none"> <li>Past vaccine given in high endemic areas</li> <li>Not really protective, efficacy 0-80%</li> <li>Will lead to a (+) PPD result</li> <li>Assume pts with PPD are infected regardless of BCG vaccine</li> </ul>
	<b>Infection with other mycobacteria</b> <ul style="list-style-type: none"> <li>PPD can't distinguish from other types of mycobacteria</li> </ul>
	<b>Anergy</b> <ul style="list-style-type: none"> <li>Pts who have a dysfunctional immune system → would not react to skin test</li> <li>HIV pts, elderly, critically ill, malnourished, immunosuppressed</li> </ul>
<b>INTEFERON GAMMA RELEASE ASSAY (IGRA)</b>	<ul style="list-style-type: none"> <li>Detects patients who have been infected (exposed), but doesn't determine if they have <u>active disease</u></li> <li>Blood test and not skin testing</li> <li>High sensitivity and specificity</li> <li>Expensive, need a lab</li> <li>Ex// Quantiferon Gold or T-SPOT</li> </ul>

**GOALS OF THERAPY:**

- Start LTBI treatment, based on the TST and risk interpreter
- Prevent reactivation of disease
- Prevent ADR from treatment

**VIABLE TREATMENT OPTIONS:**

- INH 300 mg/day x 9 months (RCT, level I evidence)
  - RCT actually done with 12 months of INH
  - Subgroup analysis shows no difference in efficacy between 12 months and 9 months = hence 9 month regimen
  - 80% compliance → 93% protection, 60-68% compliance → 49% protection
- RMP daily x 4 months (Level II evidence, RCT ongoing vs. INH)
  - Seems to be well tolerated
- INH 900 mg + RPT 900 mg once weekly x 3 months under DOT
  - Better efficacy due to higher completion rates with the once weekly regimen
  - Post-marketing reports of hypersensitivity rxns with RPT
